

Functional and logic programming

- written exam -

Important:

1. Subjects are graded as follows: By default - 1p; A – 2p; B - 4p; C - 3p.
2. Prolog problems will be resolved using SWI Prolog. The following are required: (1) explanation of the code and of the reasoning behind it; (2) recursive model that solves the problem, for all the predicates used; (3) specification of every predicate (parameters and their meaning, flow model, type of the predicate - deterministic/non-deterministic).
3. Lisp problems will be resolved using Common Lisp. The following are required: (1) explanation of the code and of the reasoning behind it; (2) recursive model that solves the problem, for each function used; (3) specification of every function (parameters and their meaning).

A. Let L be a list of numbers and given the following PROLOG predicate definition **f(list, integer)**, with the flow model (i, o):

f([], 0).

f([H|T], S):-**f(T, S1)**, S1<H,!, S is H.

f(_|T], S):-**f(T, S1)**, S is S1.

Rewrite the definition in order to avoid the recursive call **f(T, S)** in both clauses. Do NOT redefine the predicate. Justify your answer.

B. Write a PROLOG program that generates the list of all combinations of k elements with the value of sum of each combination even number, from a list of integers. Write the mathematical models and flow models for the predicates used. For example, for the list $L[6, 5, 3, 4]$, $k=2 \Rightarrow [[6,4],[5,3]]$ (not necessarily in this order).

C. Write a Lisp function to substitute all numerical values at any level of a given nonlinear list with a given value **e**. **A MAP function shall be used.**

Example, for the list (1 d (2 f (3))), **e**=0 the result is (0 d (0 f (0))).
